Maintenance of Wind Power Plants

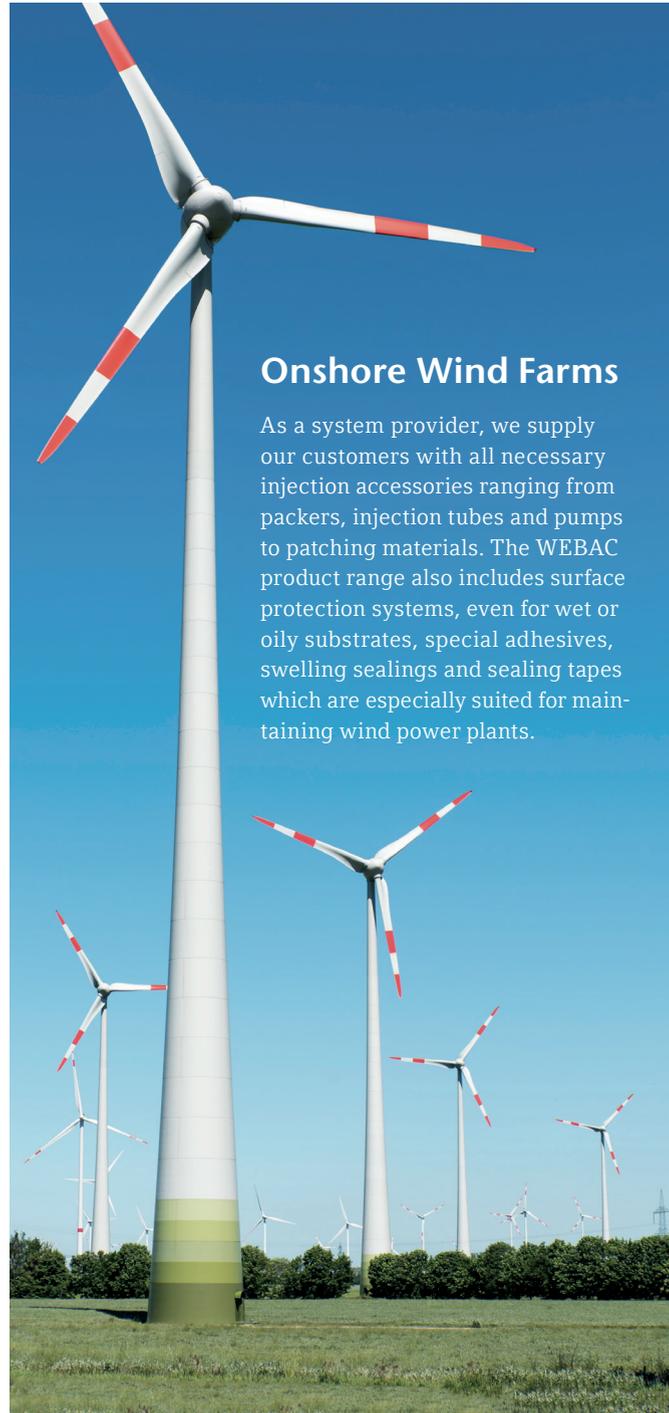

Maintenance of Concrete Foundations of Wind Power Plants

- ▶ Concrete foundations of wind power plants must withstand high dynamic loads. Cracks often form in structural reinforced concrete which necessitate either tenacious yet solid or structural closing to avoid serious damage.

Injection scheme for the maintenance of concrete foundations with WEBAC packers and WEBAC injection material

WEBAC Epoxy Injection Resins and special solid polyurethane resins are especially designed for the post-construction repair of concrete parts such as foundations exposed to extreme loads.

Onshore Wind Farms

As a system provider, we supply our customers with all necessary injection accessories ranging from packers, injection tubes and pumps to patching materials. The WEBAC product range also includes surface protection systems, even for wet or oily substrates, special adhesives, swelling sealings and sealing tapes which are especially suited for maintaining wind power plants.

Offshore Wind Farms

WEBAC has considerable experience in the maintenance of wind power plants, in which WEBAC products were used successfully.

Our newly developed Hybrid Injection Resin (HIS) is an interesting alternative, especially in the maintenance of Grout compounds!
